Step 1: Create folder and files

In C:/ipd11/php, I created "**assignment.com**" folder.
Under "assignment.com", I created: "**logs**" and "**myapp**" folder, **index.php**, and **q1.php**.

Step 2: Add hostname to hosts file

In **C:\Windows\System32\drivers\etc\hosts**, I added:

127.0.0.1   assignment.com

Step 3: Add Apache virtual host configuration file

In **C:\ipd11\php\vhosts**, I added: **assignment.com.conf** file with the following content

```
<VirtualHost assignment.com:8080>
 ServerName assignment.com
 DocumentRoot "C:/ipd11/php/assignment.com"
 ErrorLog "C:/ipd11/php/assignment.com/logs/error.log"
 CustomLog "C:/ipd11/php/assignment.com/logs/access.log" combined
 <Directory "C:/ipd11/php/assignment.com">
   AllowOverride All
   Allow from all
   Require all granted
   DirectoryIndex index.html index.php
 </Directory>
</VirtualHost>
```
